1. INTRODUCTION

1.1 Project Overview

Auto Ticket Classification using Flow Designer automates the classification and assignment of ServiceNow service tickets. Based on the configured conditions and the ticket information, the system identifies the appropriate ticket category and automatically routes the ticket to the relevant support group, without manual triage.

1.2 Purpose

The purpose of this project is to reduce the manual effort and delay involved in sorting incoming tickets, to improve the consistency of classification, and to ensure that every ticket reaches the right support team quickly.

2. IDEATION PHASE

2.1 Problem Statement

Support teams receive tickets that describe hardware, software and network issues. Classifying and assigning each ticket by hand is slow and error-prone, which delays resolution and can send tickets to the wrong team. A rule-based automated workflow is needed to classify tickets and assign them as soon as they are created.

2.2 Empathy Map Canvas

2.3 Brainstorming

Auto Ticket Classification using Flow Designer

Use this template to plan and visualize how we will automate ticket classification, categorization, assignment and routing in ServiceNow using Flow Designer to improve efficiency and reduce manual work.

30 minutes to prepare
1 hour to collaborate
3-6 people recommended

1 Before you collaborate

A little bit of preparation goes a long way with this session. Here's what you need to do to get going.

10 minutes

- Team gathering**
Invite the right people to the session and send an invite.
- Gather input**
Collect current ticket handling challenges, ideas and expectations from the team.
- Set the goal**
Define what success looks like for automated ticket handling.
- Learn how to use the Flow Designer tools**
Use the Canvas and components to build and test flows.

2 Define your problem statement

What problem are we trying to solve?
 Frame your problem as a How Might We statement. This will be the focus of your brainstorm.

5 minutes

EXAMPLE

How might we automate ticket handling to reduce manual work and improve ticket accuracy?

Key rules of brainstorming

To run an effective and productive session

- Stay on topic.
- Defer judgment.
- Go for volume.
- Encourage wild ideas.
- Listen to others.
- If possible, be visual.

3. REQUIREMENT ANALYSIS

3.1 Customer Journey Map

CUSTOMER JOURNEY	DISCOVER	DECIDE	ORDER	WAIT	RECEIVE	RETURN
Stages and experience	Becomes aware	Chooses a meal	Places the order	Tracks delivery	Gets the food	After the experience
1 Steps What does the person typically experience?	Sees food offers on app/social media	Browses restaurants, menus and ratings	Selects items, customizes order	Tracks rider and estimated arrival	Receives order, checks items	Rates experience and may reorder
Interactions What interactions do they have at each step?	App home page; search; ads; recommendations	Restaurant page; photos; reviews; price comparison	Cart; address; payment; coupon; order confirmation	Live map; push notifications; rider contact	Delivery handoff; package/food; order history	Rating screen; help centre; reorder button
Goals & motivat What is the person trying to achieve?	Find something tasty within budget	Choose a reliable restaurant	Order quickly with correct details	Know exactly when food will arrive	Get fresh, complete and correct food	Feel satisfied and save time next order
Positive momen What creates delight or confidence?	Relevant recommendations match current craving	Clear photos, ratings and delivery estimate	Fast checkout and simple payment	Accurate tracking and useful updates	Food arrives warm; order is complete	Easy rating and one-tap reorder
Negative momen What creates frustration or uncertainty?	Too many choices; unclear offers	Hidden charges or unclear reviews	Coupon fails; address/payment error	Delivery estimate keeps changing	Missing item, spillage or cold food	Slow complaint resolution
Areas of opport What might we do better?	Personalize discovery by budget and time	Show total price; quality signals clearly	Simplify checkout and validate address early	Improve ETA accuracy and proactive alerts	Add quality checklist before handoff	Close the loop with fast recovery and loyalty

3.2 Solution Requirement

Functional requirements:

- Create a service ticket with the required information.
- Automatically classify a newly created ticket.
- Automatically assign the ticket to the appropriate support group.
- Execute the configured Flow Designer workflow on ticket creation.

- Handle tickets that do not match the predefined conditions.

Non-functional requirements:

- The flow should execute within the defined performance target.
- The flow should run reliably and consistently for different ticket types.

3.3 Data Flow Diagram

3.4 Technology Stack

Component	Technology
Platform	ServiceNow Developer Instance
Automation	Flow Designer
Module	Service Management
Environment	ServiceNow Development Environment

4.3 Solution Architecture

5. PROJECT PLANNING & SCHEDULING

5.1 Project Planning

Sprint	Task	Duration	Status
[Sprint 1]	[Task details]	[Dates]	[Status]
[Sprint 2]	[Task details]	[Dates]	[Status]

6. FUNCTIONAL AND PERFORMANCE TESTING

6.1 Performance Testing

Five functional and three performance test cases were executed. All 8 passed with no failures (100% pass rate).

Test ID	Scenario	Expected Result	Actual Result	Result
FT-01	Ticket Creation Validation	Valid tickets created; validation shown for missing mandatory fields.	Ticket creation and field validation worked as expected.	PASS
FT-02	Automatic Ticket Classification	Ticket classified automatically per configured conditions.	Tickets were classified according to the configured rules.	PASS
FT-03	Automatic Assignment Group Selection	Ticket assigned to the appropriate support group.	Tickets were assigned to the appropriate support groups.	PASS
FT-04	Flow Execution Validation	Flow triggers automatically and executes all actions.	Flow Designer flow triggered and completed successfully.	PASS

Test ID	Scenario	Expected Result	Actual Result	Result
FT-05	Unclassified Ticket Handling	Unmatched ticket handled by default logic without flow failure.	Unmatched tickets handled without flow failure.	PASS
PT-01	Flow Execution Time Test	Flow executes within the defined performance target.	Execution completed within the expected time.	PASS
PT-02	Multiple Ticket Processing Test	All tickets processed correctly without failures.	Multiple tickets processed successfully.	PASS
PT-03	Flow Reliability Test	Flow executes consistently for different ticket types.	Flow executed successfully and consistently.	PASS

Testing Type	Test Cases	Passed	Failed
Functional Testing	5	5	0
Performance Testing	3	3	0
Total	8	8	0

7. RESULTS

7.1 Output Screenshots

8. ADVANTAGES & DISADVANTAGES

8.1 Advantages

- Removes manual triage and speeds up ticket routing.

- Applies the same classification rules to every ticket.
- Built on Flow Designer, so rules are easy to maintain without heavy coding.
- Unmatched tickets are handled without causing flow failure.

8.2 Disadvantages

- Classification depends on predefined conditions, so new issue types need new rules.
- It does not learn from data, as no machine-learning model is used.
- Unusual or ambiguous descriptions may fall into the default handling.

9. CONCLUSION

9.1 Project Summary

The project automates ticket classification and assignment in ServiceNow using Flow Designer. All functional and performance tests passed, confirming that tickets are classified and routed correctly.

9.2 Key Outcomes

- Tickets are classified automatically according to the configured conditions.
- Tickets are assigned to the appropriate support group.
- The flow handled unmatched tickets and multiple tickets reliably.
- All 8 test cases passed (100%).

10. FUTURE SCOPE

10.1 Enhancement Opportunities

- Add more categories and finer-grained classification conditions.
- Add notifications to assignees and requesters.
- Add dashboards to track classification and assignment performance.

10.2 Future Automation

- Use machine learning or NLP to classify tickets from their descriptions.
- Automate priority assignment and escalation.
- Extend the flow to other ticket types and modules.
