Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	4 Marks

Empathy Map Canvas:

When we empathize with IT support agents and service desk managers, we see that they are overwhelmed by the large volume of incoming tickets that require manual classification. They are trying to quickly categorize and prioritize tickets so that urgent issues can be resolved without delay. However, manual classification is slow, error-prone, and inconsistent, which creates bottlenecks and increases resolution time. This happens because ticket descriptions vary widely and depend heavily on individual judgment, making standardization difficult. As a result, agents feel frustrated and anxious about missing critical issues, while managers feel concerned about customer satisfaction and team efficiency.
